EXPERIMENT 7: USER, ROLES AND PERMISSIONS

1. Aim

To configure and understand user roles, permission profiles, role hierarchy, and data-sharing settings in the WattWise application using Zoho Creator.

2. Software Required

- Zoho Creator
- WattWise — Household Energy Habit Analyzer

3. Theory

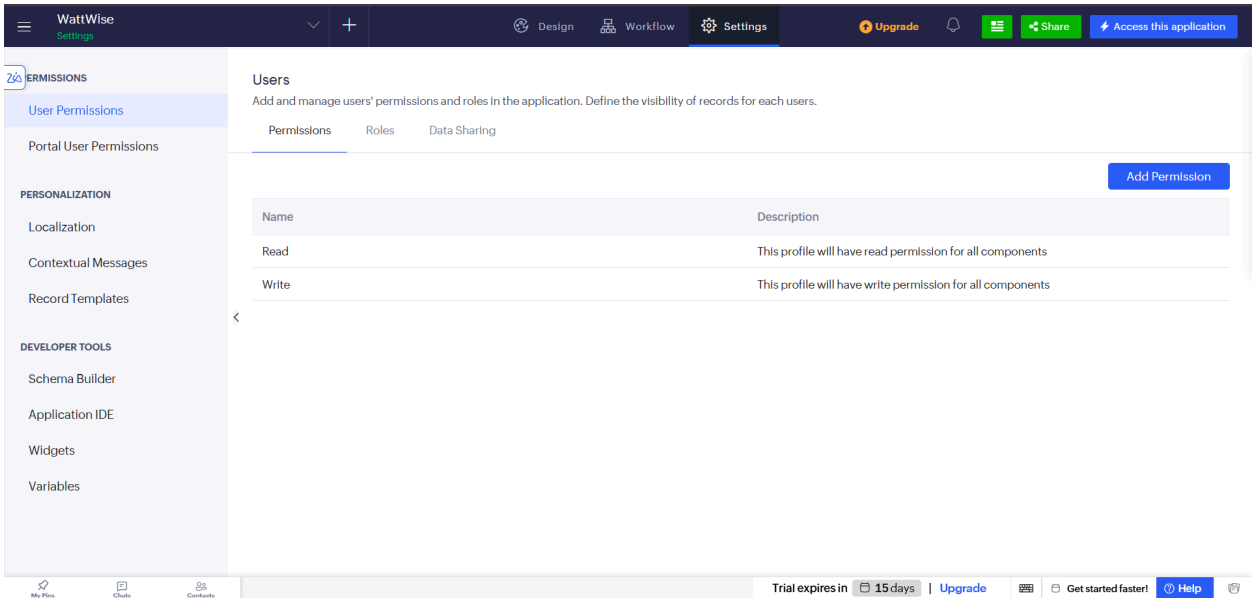

User roles and permissions are used to control access to an application and its records.

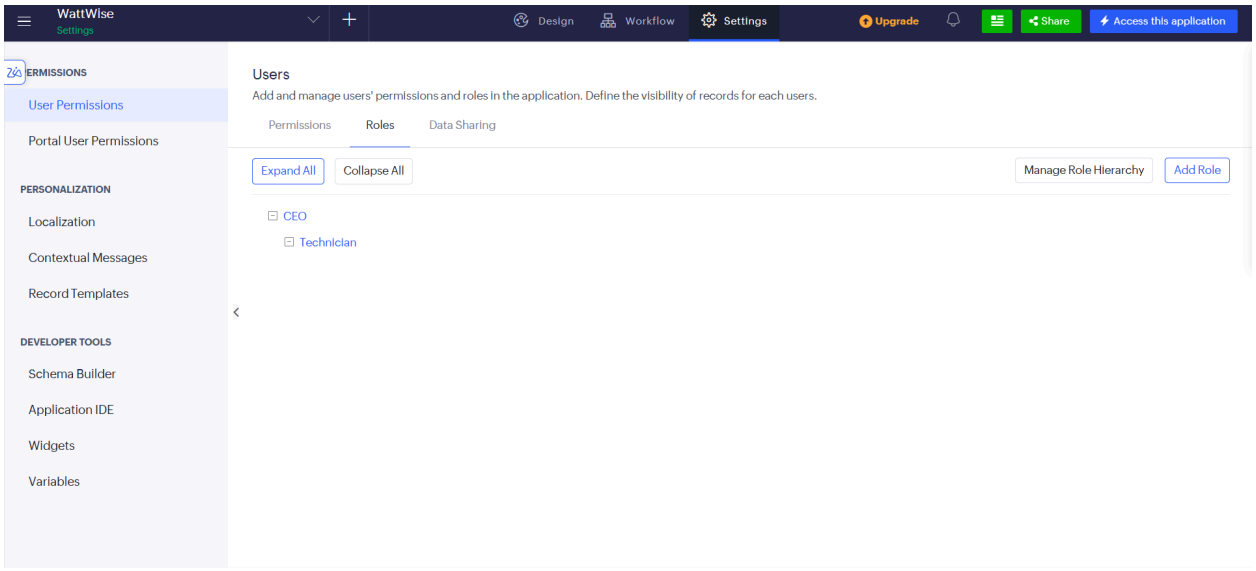

- **User Permissions:** Used to manage user access and permissions within the application.
- **Roles:** Define the position of users in the role hierarchy.
- **Role Hierarchy:** Represents the reporting relationship between different roles.
- **Permission Profiles:** Define the access level available to users. The existing profiles in WattWise are Read and Write.
- **Data Sharing:** Controls how records are shared between users.
- **Portal User Permissions:** Manages access for external portal users. This feature required an account upgrade in the current Zoho Creator plan.

4. Procedure

1. Opened the WattWise application in Zoho Creator.
2. Navigated to **Settings → User Permissions**.
3. Explored the available sections: Permissions, Roles, and Data Sharing.
4. Opened the Roles section and created a new role named **Technician**.
5. Selected **CEO** as the reporting role for Technician.
6. Verified the role hierarchy as **CEO → Technician**.
7. Opened the Data Sharing section and observed that no data-sharing rules had been configured.
8. Opened the Permissions section and viewed the existing **Read** and **Write** permission profiles.
9. Opened Portal User Permissions and observed that customer portal access required an account upgrade.

5. Screenshots

6. Result

The user permission settings of the WattWise application were explored successfully. A Technician role was created under the CEO role, and the existing permission profiles and data-sharing settings were examined. The customer portal feature was found to require an account upgrade.
