EXPERIMENT 5: CREATION OF DASHBOARD USING ZOHO CREATOR

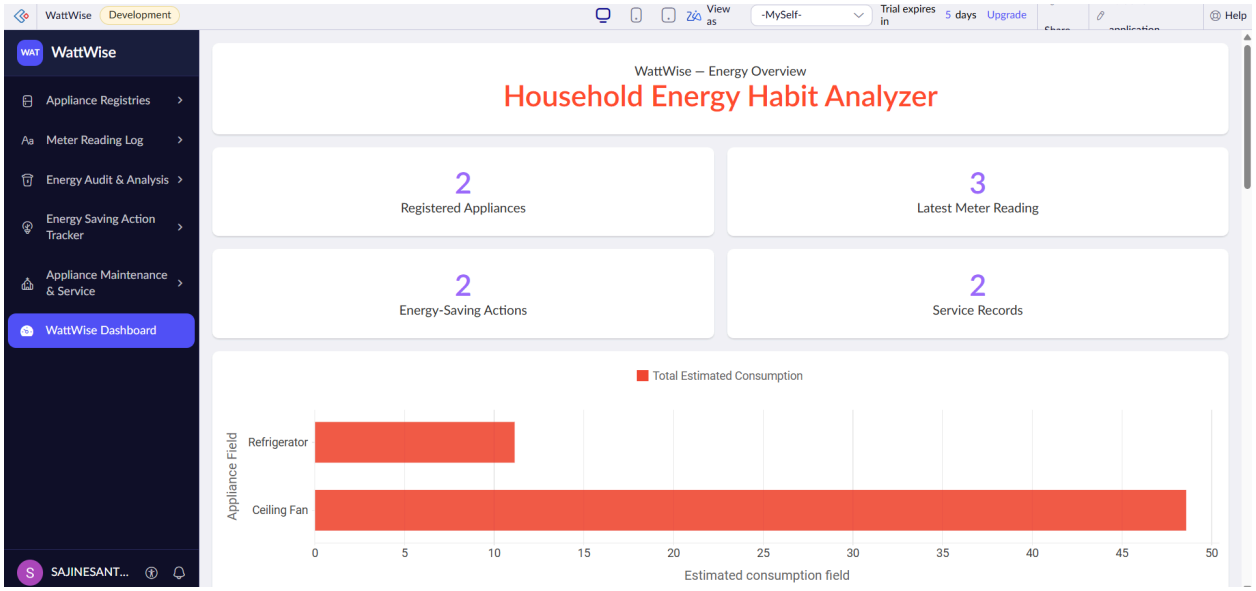

AIM:

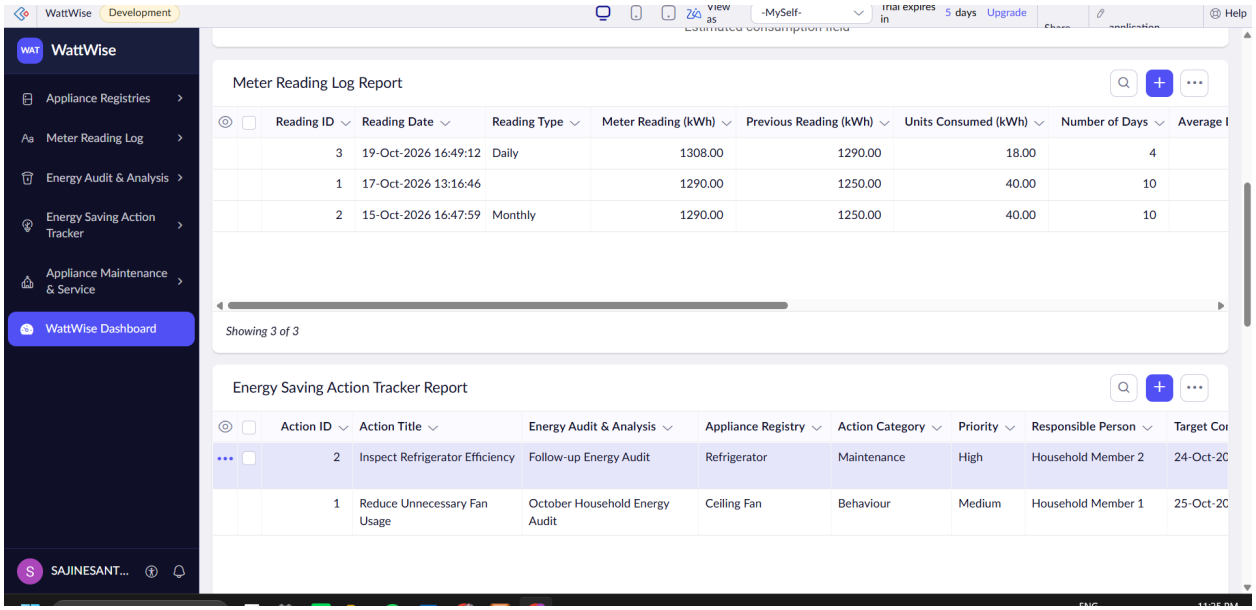

To create an interactive dashboard for the WattWise – Household Energy Habit Analyzer application using Zoho Creator to monitor appliance details, energy consumption, energy-saving actions, and maintenance records.

PROCEDURE:

1. Opened the WattWise application in Zoho Creator and accessed the Page Builder.
2. Created a dashboard page named WattWise Dashboard.
3. Added summary panels to display the total number of registered appliances, meter reading records, energy-saving actions, and service records.
4. Configured the panels using the Count option and selected the corresponding forms as data sources.
5. Added a chart to visualize energy consumption using data from the Energy Audit form.
6. Embedded the Meter Reading Log Report, Energy Saving Action Tracker report, and Appliance Maintenance & Service report into the dashboard.
7. Configured the dashboard components and verified that the summary panels displayed the records available in the application.
8. Updated the relevant energy audit record to correct the missing appliance category displayed as Unknown in the chart.
9. Previewed the dashboard to verify the arrangement and display of its components.

OBSERVATION:

The WattWise dashboard was successfully created using Zoho Creator Page Builder. Four summary panels displayed the record counts from their respective forms. The energy consumption chart visualized estimated consumption values from the energy audit records. The embedded reports provided access to meter readings, energy-saving actions, and appliance maintenance details from a single dashboard page. The dashboard helped organize household energy information in a clear and accessible format.

RESULT:

The WattWise dashboard was successfully created using Zoho Creator. It integrates summary panels, a chart, and embedded reports to provide an overview of household energy consumption and appliance maintenance activities.

CONCLUSION:

The experiment demonstrated how Zoho Creator dashboards can combine form data, charts, and reports in a single interface. The dashboard improves the visibility of energy usage records and supports monitoring of energy-saving actions and appliance maintenance.
